### Comments /notes on tonight's mission and this interpretation

Imagery was clear with little distortion.

Used previous IR perimeter from 7/4 as a starting point for tonight's interpretation

There was no heat perimeter expansion detected tonight, with just one area of scattered heat in the main part of the perimeter and one isolated heat source, also inside the main perimeter. No heat was detected in any of the isolated perimeter areas tonight. The one heat source that was on the saddle to the north of the fire on the last IR flight was not detected tonight and was in fact removed from the heat perimeter as it didn't seem to be associated with this fire.

No intense heat was detected tonight, so there is no accompanying shapefile.
